

High Frame Field Potter

When dealing with small plants that are placed in narrow rows, often larger skid steer loader-mounted spades are not nimble enough to work properly. Dutchman has found a solution to this issue. The new "high-frame" excavator-mount potter is everything one would want when digging in narrow planted rows.

The new high-frame potters can be built on either a 15 degree or 25 degree angle to fit the basket of choice properly. They will use minimal ground space when working and offer excellent visibility as the operator can look under the spade instead of overtop. Built up to 20 inch in size, the high frame potter can dig in areas as tight as 2' by 2' centers and can be outfitted with electronic controls. Optional adjustable legs will allow one the ability to vary the root ball depth.
